%emporar# 'nvironment

The Temporary environment is accessed through the set and

ncoderContFallThrough

This option tells the Framework to not fall through to remaining &ncoders if the entire preferred list fails. This is useful for keeping your stealthiness on a network, and not accidentally falling through to an unwanted &ncoder because your preferred &ncoder failed.

4op

This has the same behavior as the &ncoder entry above, except it is used to specify the list of preferred 4op generator modules. The 4op generators can be listed with show nops.

```
msf> set Nop Pex
```

4opContFallThrough

This option has the same behavior as &ncoderContFallThrough, except it applies to the 4op preferred list.

random4ops

This option allows randomized nop sleds to be used instead of the standard nop opcode. /random4ops should be 0 or 1. If set to 1, all nops

7inla6ont9ill

This option can be used to exploit multiple systems at once and is particularly useful when firing a C#-based exploit at a network broadcast address.

+lternate 'xit

This option is a workaround for a bug found in certain versions of the #erl interpreter. If the msfconsole interface
